DIGITUS TEST CASE REPORT

I fulfilled Digitus Test Case between March 19th and April 2nd. I implemented both mobile and web projects. For mobile project, I used tools like React Native, React Native Paper, React Native Navigator, and Mirage.js. I used properties of React Native and React Native Paper for styling and UI design. I used React Native Navigator library to implement the navigation process. For generating a fake server API, I used Mirage.js library. During implementing the mobile project, the fact that React Native was a very new technology for me hardened me a little bit. And also, some parts of styling via React Native and React Native Paper challenged me a little bit. For web project, I used tools like React, Tailwind CSS and JavaScript. Since I was familiar with technologies like React, Tailwind CSS and JavaScript, I progressed quickly in this project. I implemented every single meaningful design unit as a component in this project. In App.js file, I used these components in the given order according to UI design in Figma. I had to deal with several icons and profile photo stylings. That process was a little bit challenging for me.
